

American Time has many dial styles to choose from for molded plastic, wood, aluminum and steel case clocks. The part number designates the dial style at the end of the 10 digit part number. For example, a clock with the part number E56BADD304 has the 04 dial style. The 04 and 01 dial styles have traditionally been our most popular dials since 1980.

The white numerals on a black dial are considered high contrast for the vision-impaired. The 24-hour dial styles are used in military, industrial and health care applications. If you have any questions on dials, please don't hesitate to contact the Clock Experts at **800-328-8996**. We are happy to help you choose the perfect dial styles and clocks for your facility.
